

SkyProbe

Monitoring the absolute atmospheric transmission in the optical
(to optimize science operations)

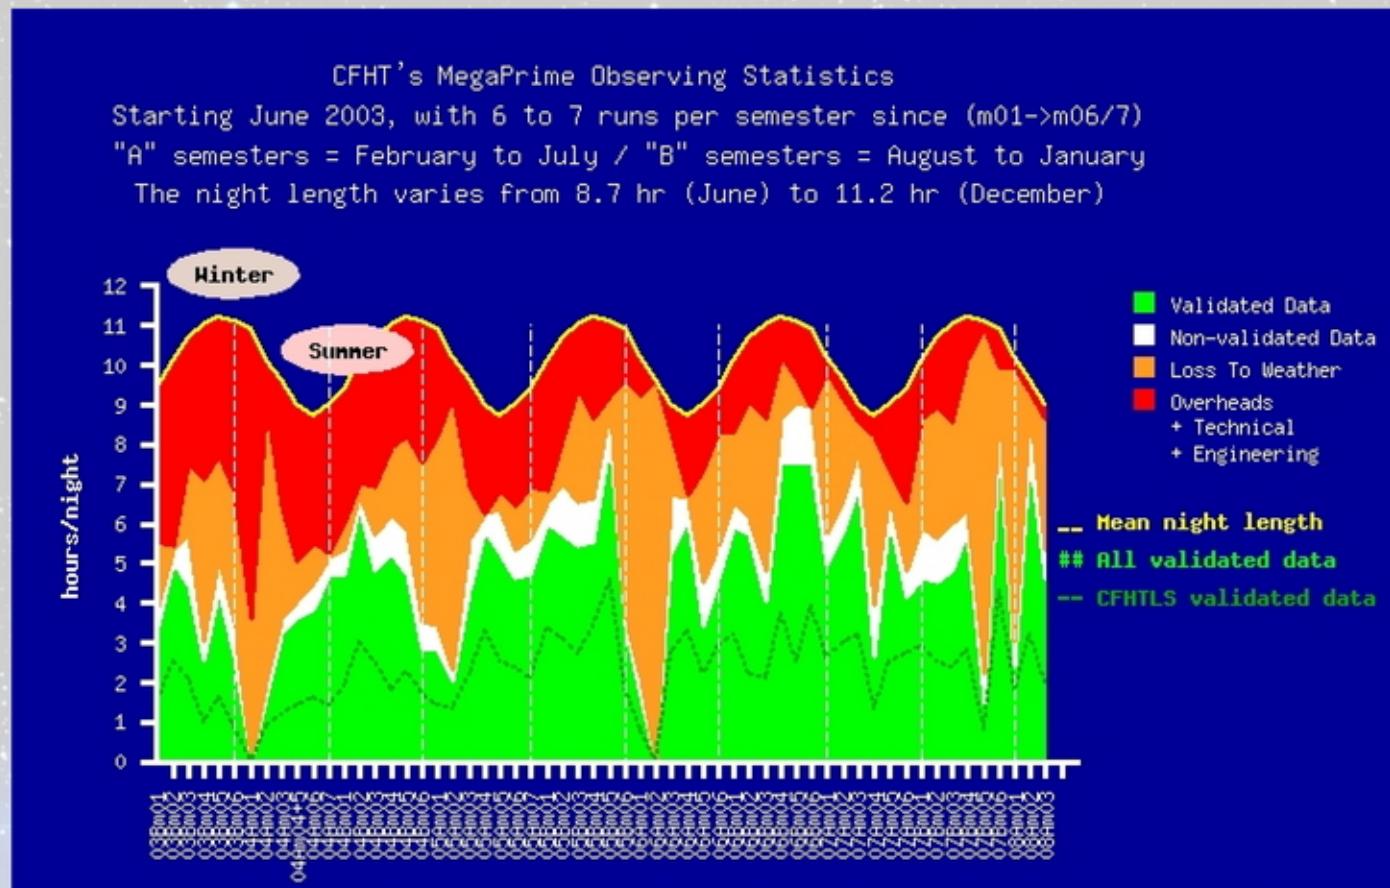

Jean-Charles Cuillandre, Billy Mahoney, Kanoa Withington
Canada-France-Hawaii Telescope Corporation

Eugene Magnier

Institute for Astronomy – University of Hawaii

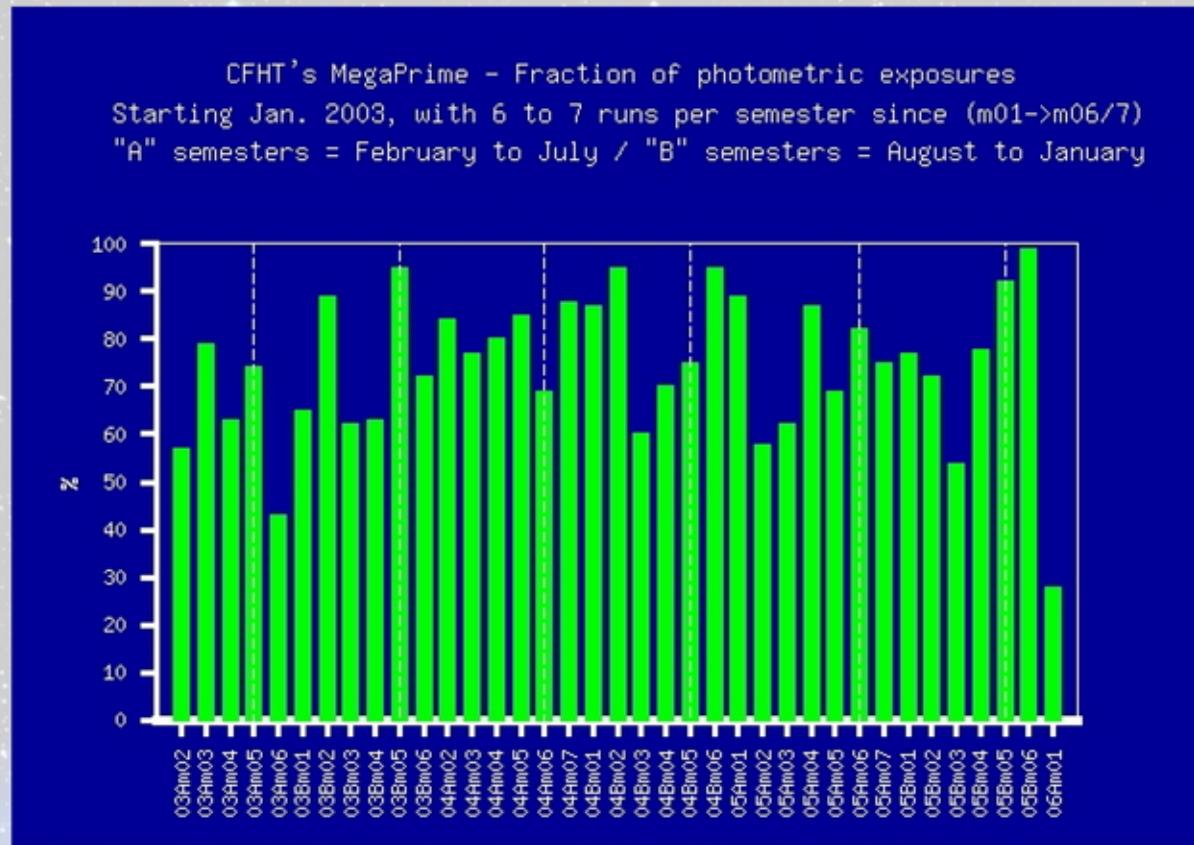

Five years of MegaCam observing statistics

Mauna Kea: 25% of the night time is lost to weather

Fraction of MegaCam data gathered in photometric conditions

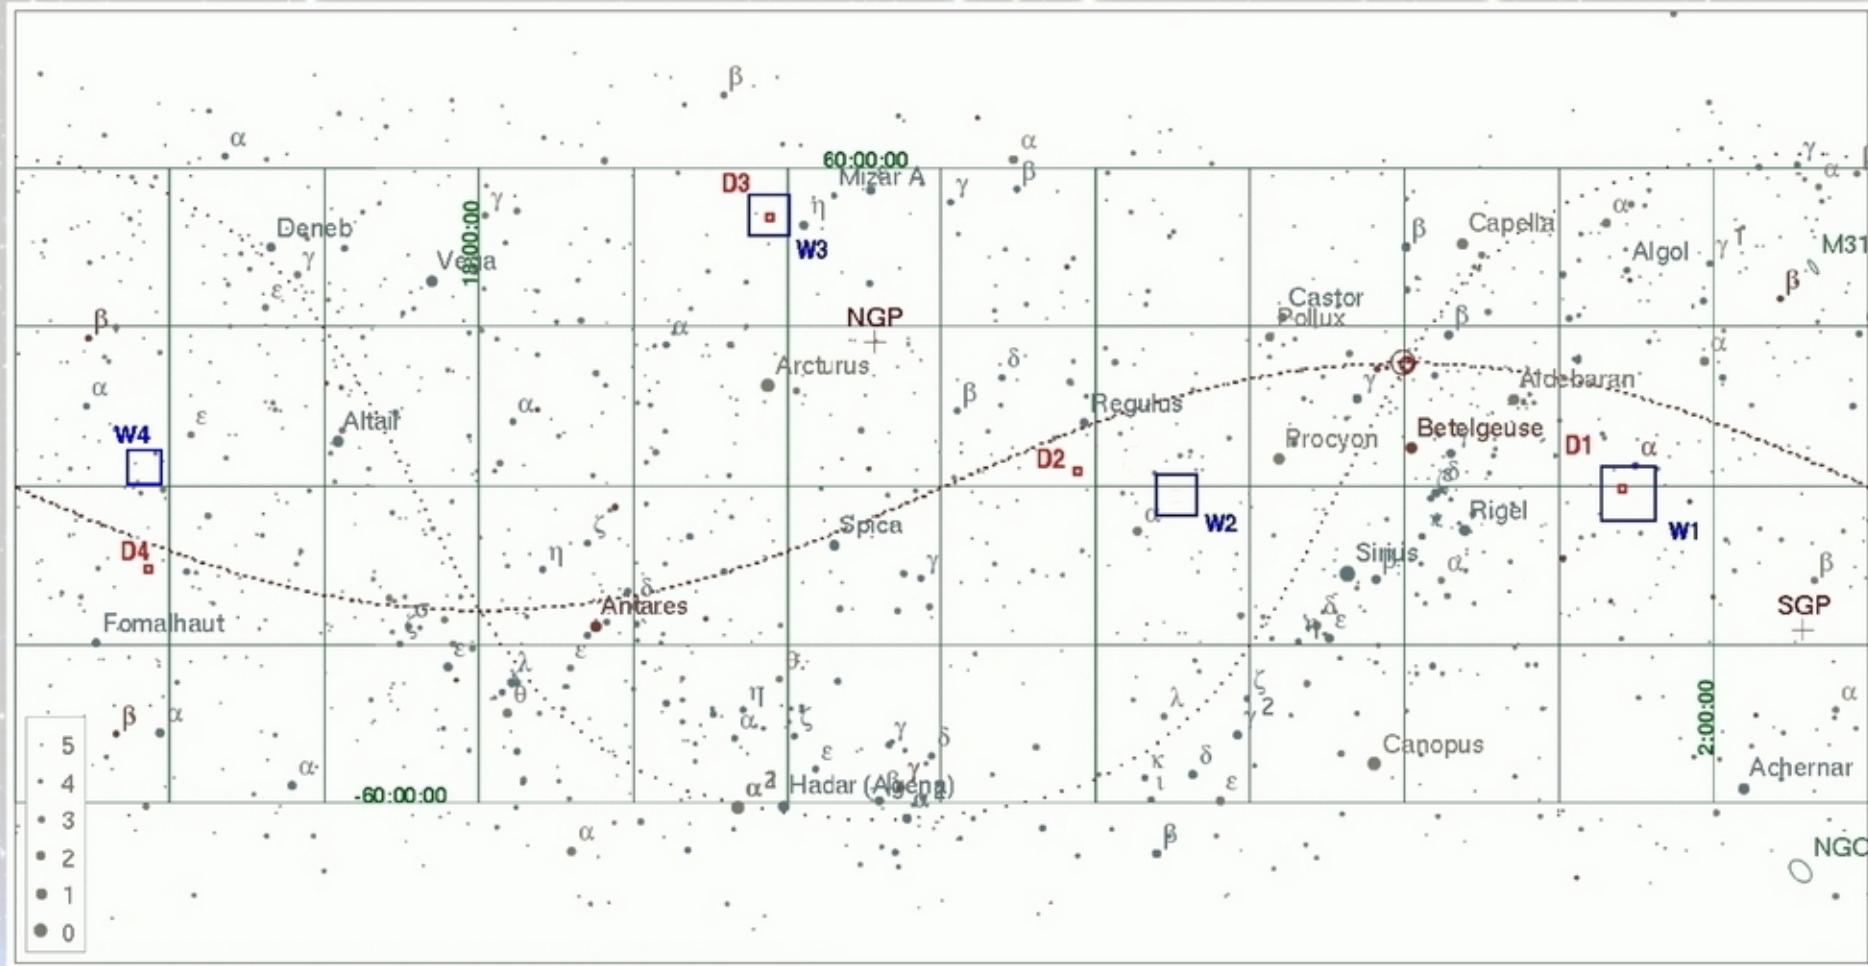

25% of observed time is affected by cirrus: 68 nights per year

All in all, Mauna Kea offers ~200 "clear" nights per year

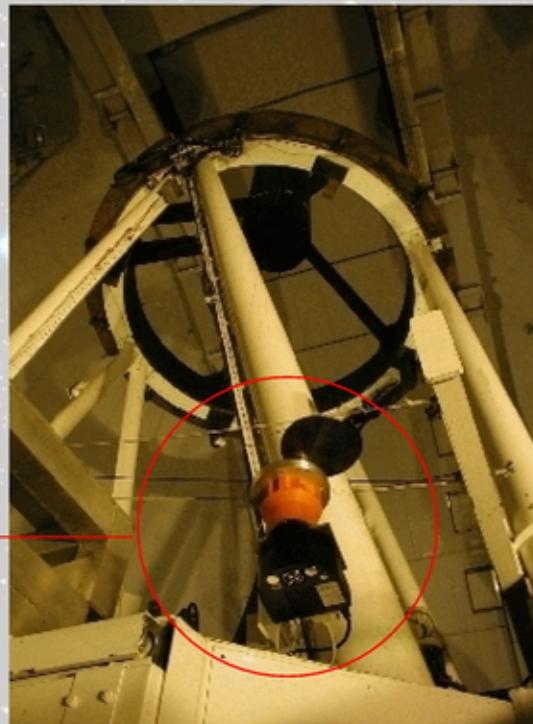

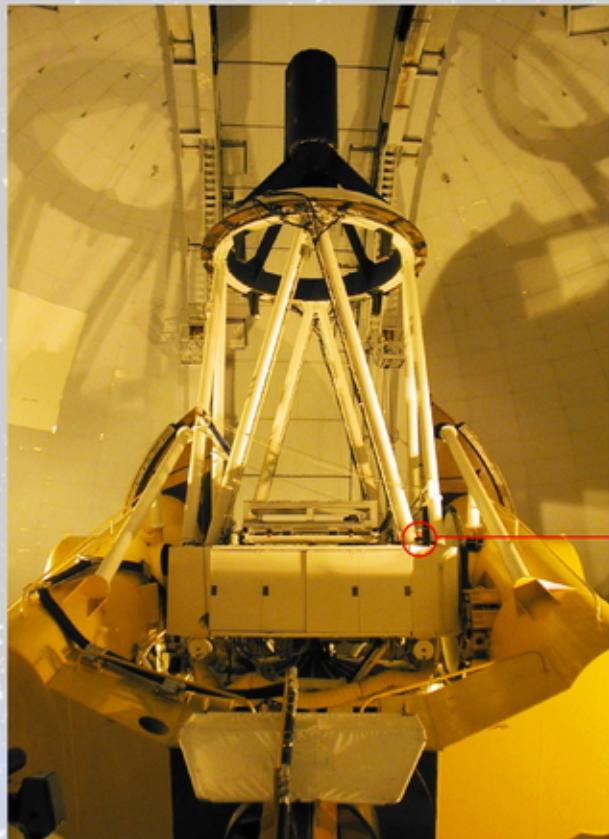

CFHTLS (Legacy Survey): a 500 nights program from 2003 to 2008

Survey	Area (sq. deg.)	Location	u^*	g'	r'	i'	z'
SNLS	4	D1/2/3/4	28.7	28.9	28.5	28.4	27.0
Wide	170	W1/2/3/4	26.4	26.6	25.9	25.5	24.8
Very Wide	410	On ecliptic		25.5	25.0	24.4	

SkyProbe (2000–today): V-band atmospheric transmission monitor

Cuillandre et al., SPIE 4844, p. 501, 2002

Developed as a full-time observatory facility

SkyProbe field of view and 30 sec. exposure depth

MegaCam footprint
18000x18000 pixels
1 sq. degree
0.19 arcsec per pixel

7x5 sq. degrees for a 765x510 CCD -- 35 arcsec. per pixel!

Uses a Nikon 50mm lens (f/1.8)

Reaches V=12 mag. in 30 seconds

SkyProbe in a nutshell

Limitations of standard approaches:

- All-sky IR (10um) cameras provide only a low resolution (but important) map of the cloud distribution
- Satellite imagery can only be used as a warning tool

SkyProbe specifications:

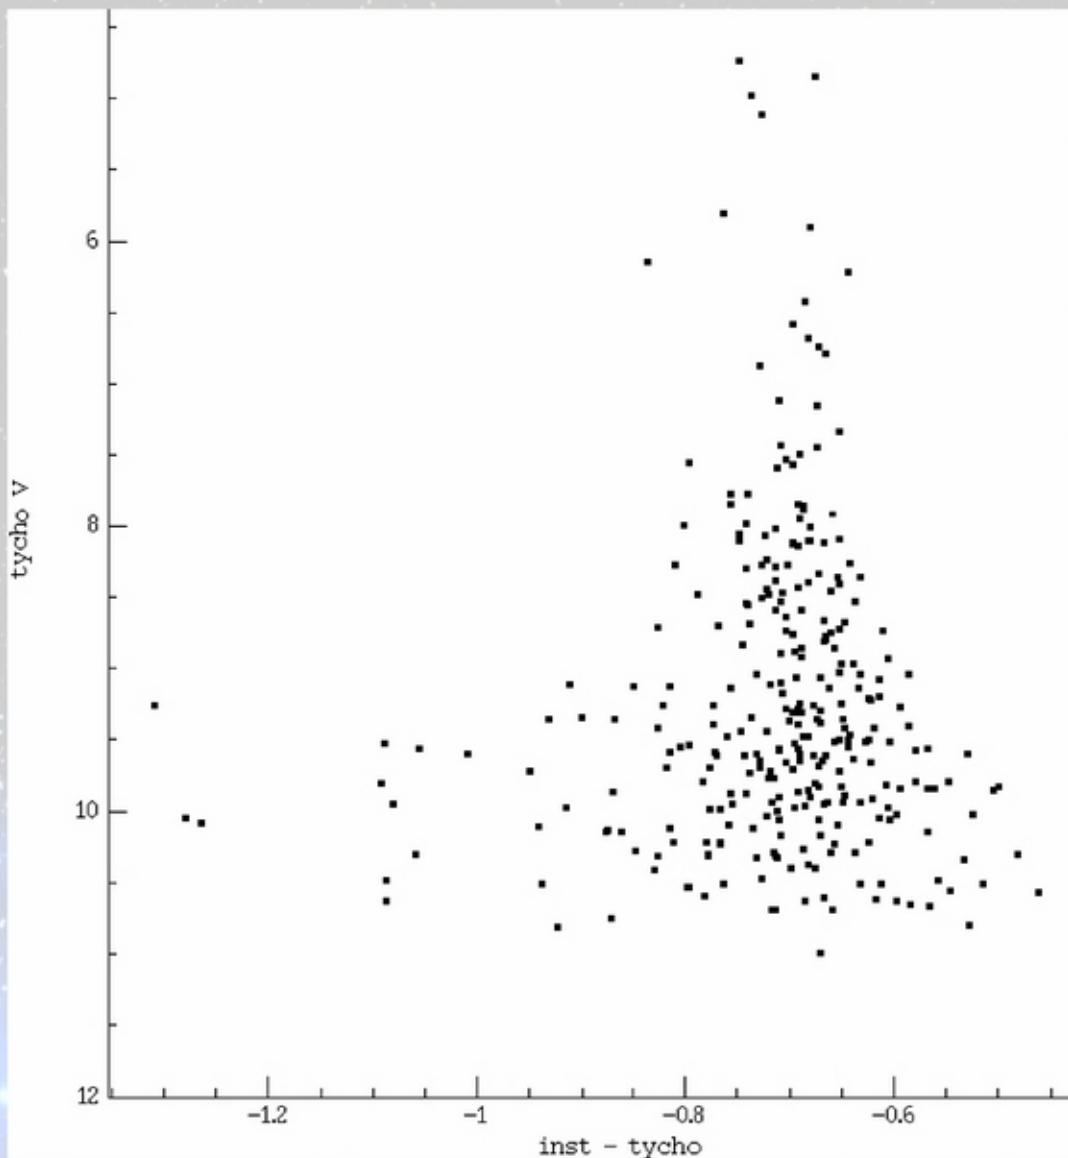

- Low cost (<\$3K for hardware) & very high reliability
- Provides an absolute zero point in the V band
- Stable response, few percents photometry accuracy
- Field of view encompassing the telescope science field
- Frequent measurements (every minute)
- Maintenance free system over 10 yrs (~1.5 million exposures)

Key developments:

- Low-cost reliable CCD cameras from the amateur astronomy
- Full sky precision photometry catalog: Tycho2 from Hipparcos
- Elixir: CFHT's optical imaging data pipeline (12K, MegaCam)

Photometry challenges

Mag-Mag diagram: scatter

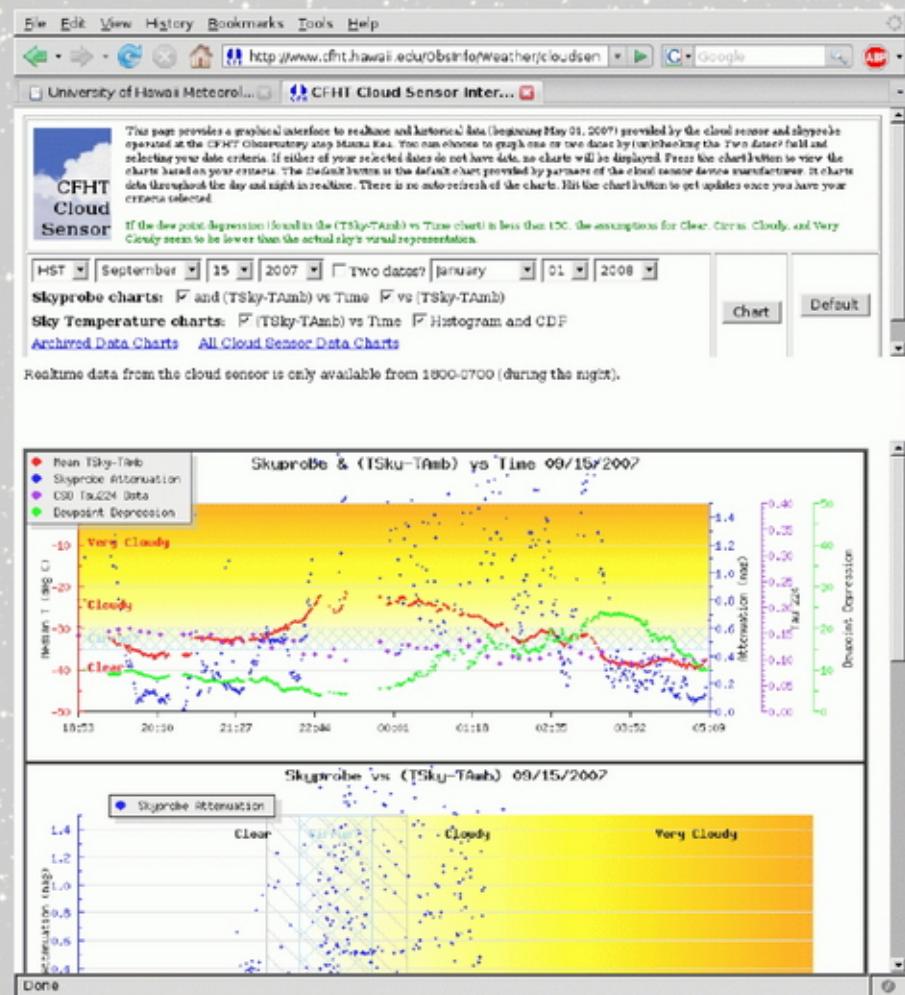

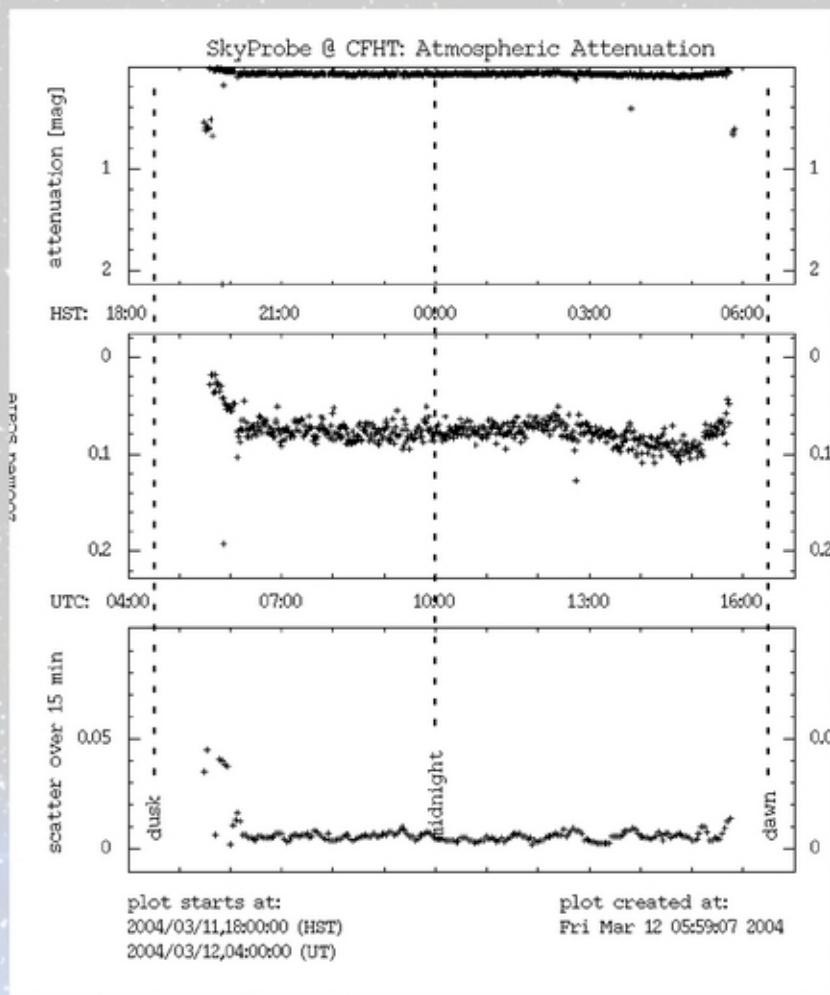

- sampling
- de-focusing

CCD design:

- transparent gate
- sub-pixel response

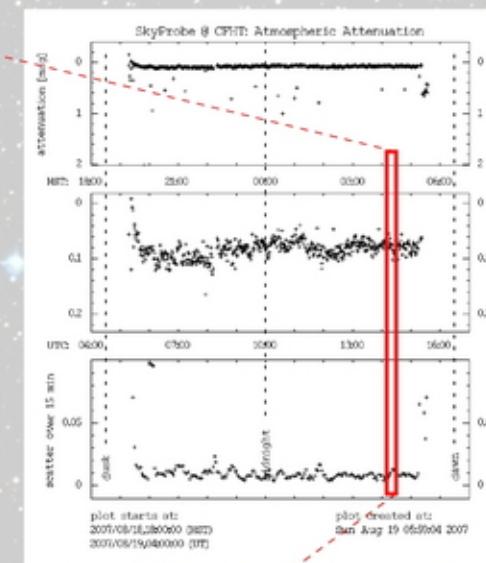

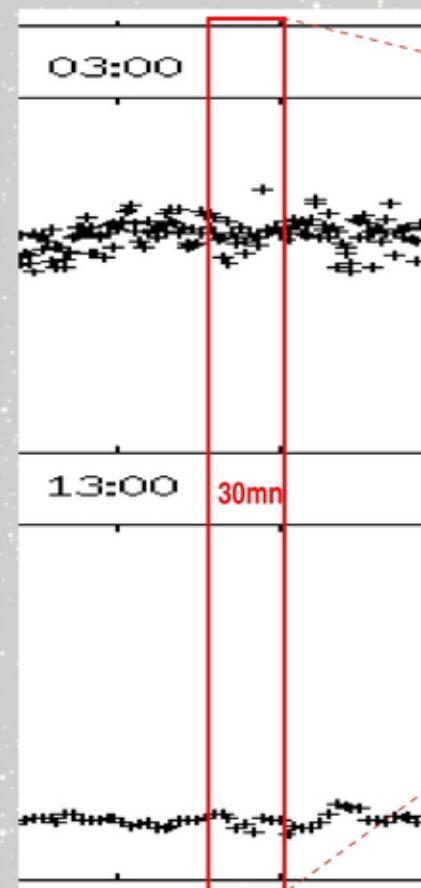

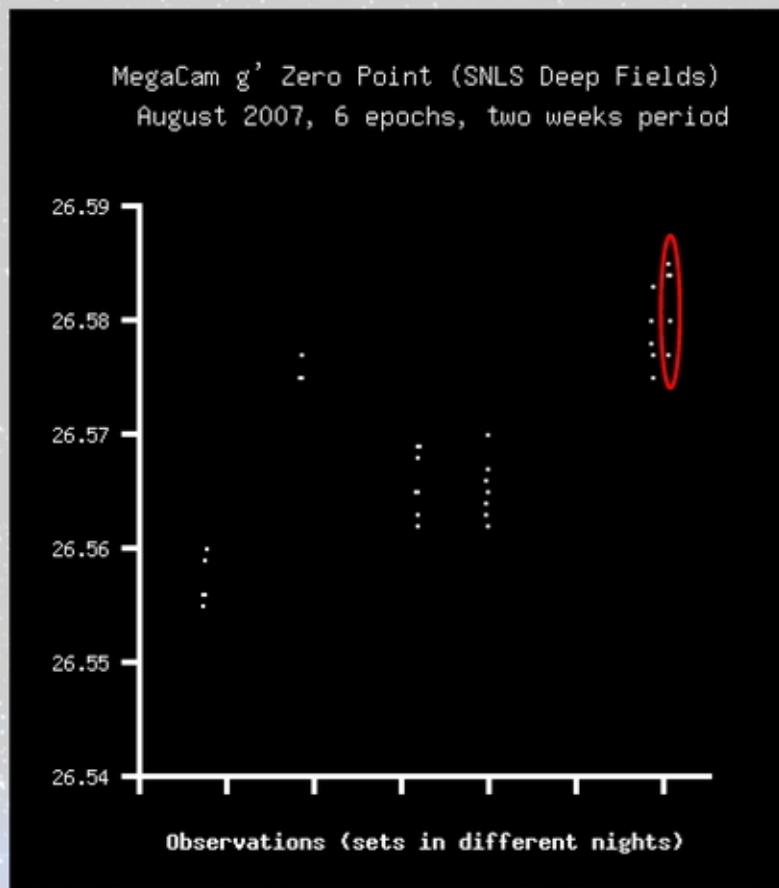

User's interface

Standalone mode (www) & CFHT Service Observing weather central

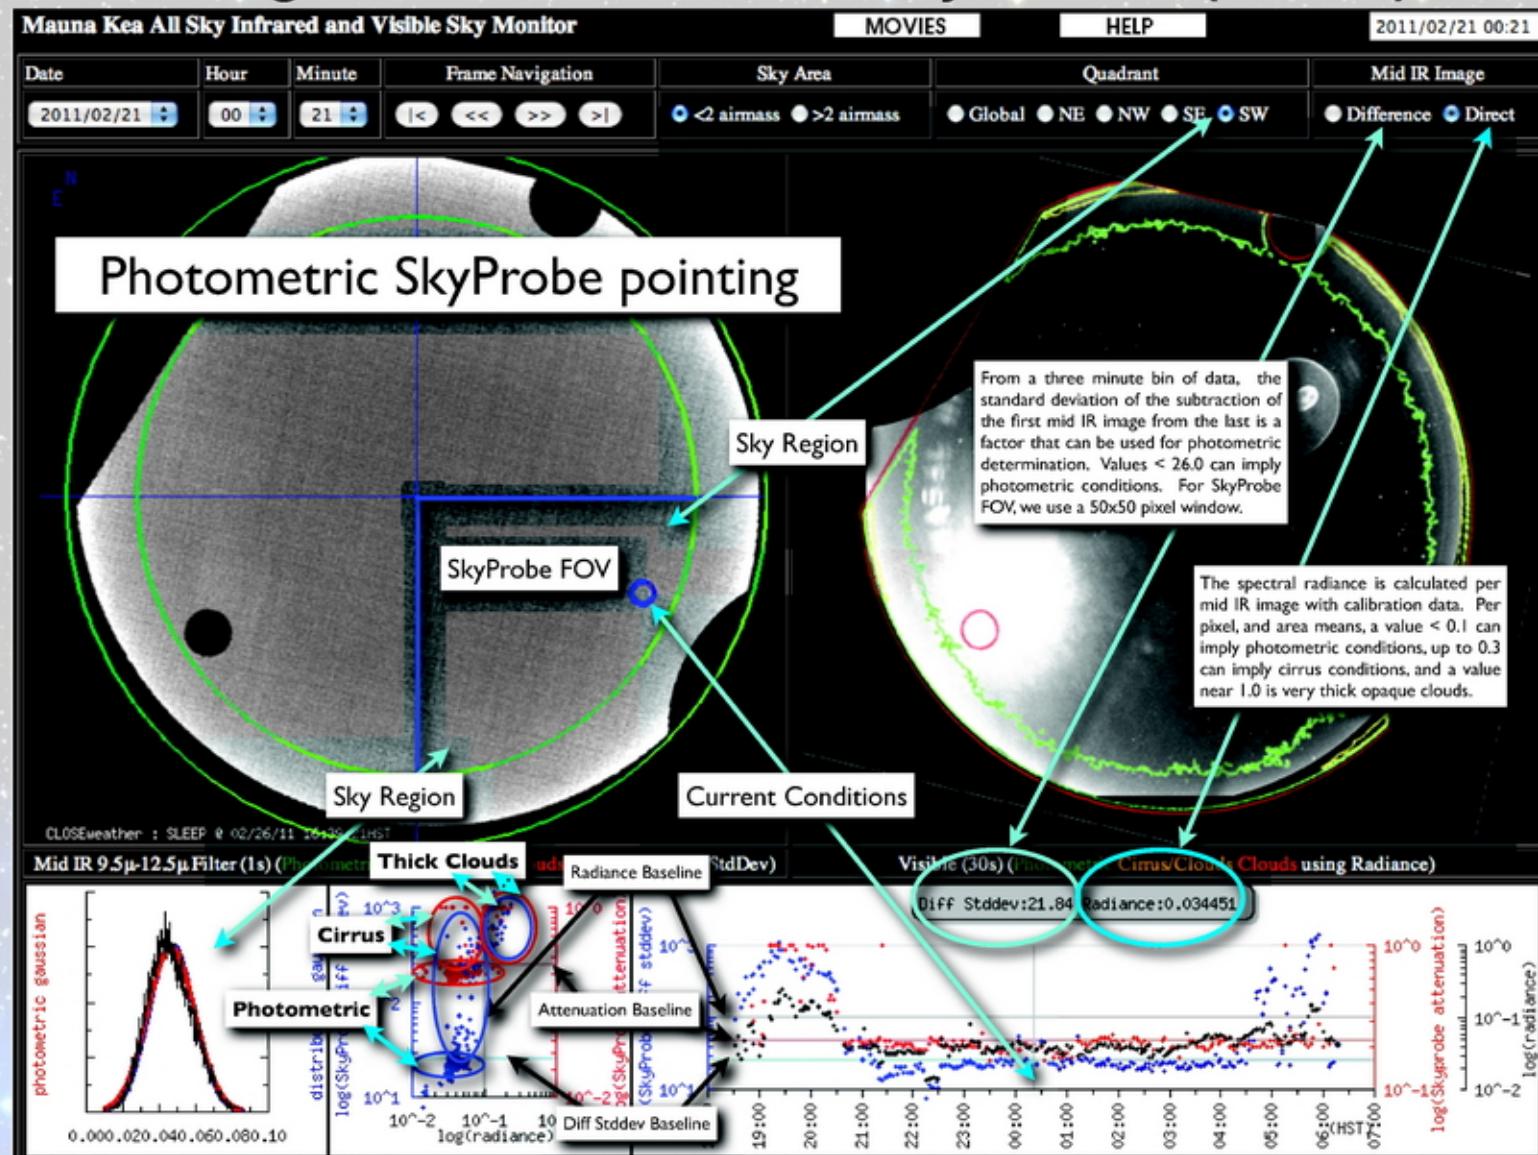

How accurate is SkyProbe? (answer: quite accurate actually!)

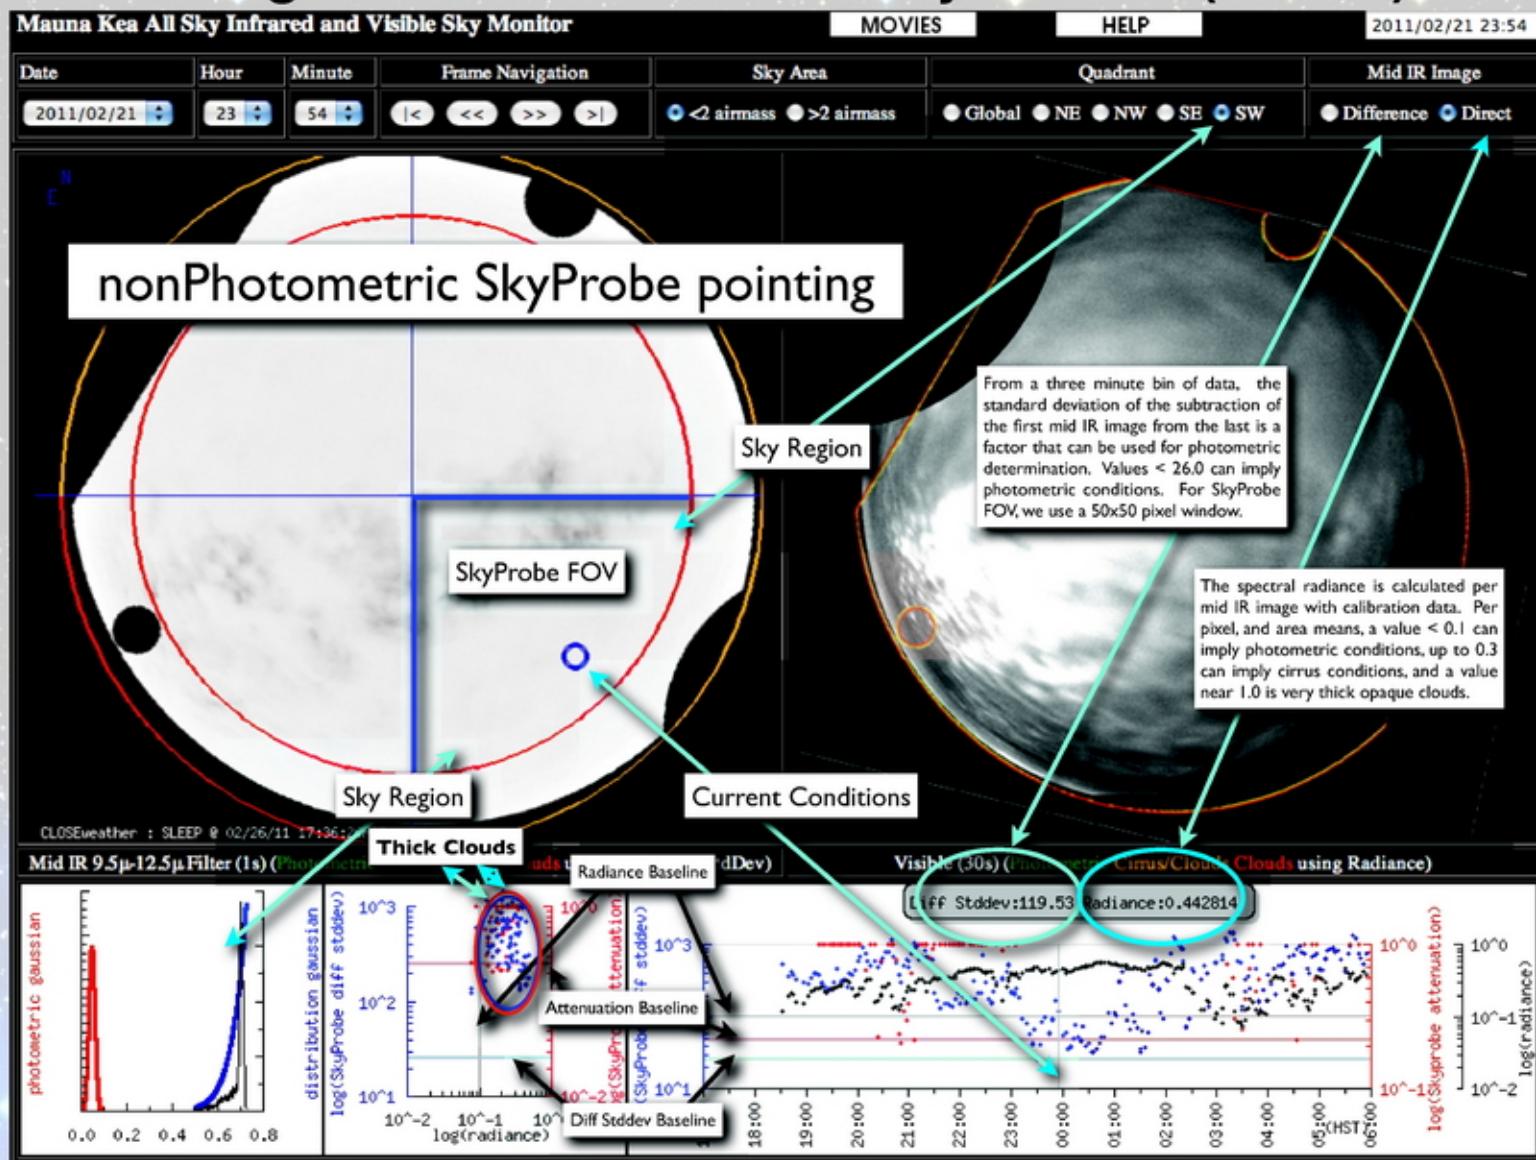

MegaCam g' zero points from CFHTLS Deep/SNLS fields
Sets of 5 exposures taken over 30mn on different nights
Red circled sequence: ref, -0.001, -0.008, -0.005, -0.001 mag.
Extinction from particulates varies above Mauna Kea from
1 to 2% on timescale of minutes, pure clear sky is very rare!

Interfacing with the infrared all-sky camera (ASIVA)

Interfacing with the infrared all-sky camera (ASIVA)

Calibration & Standardization of large Surveys - 2012 Fermilab

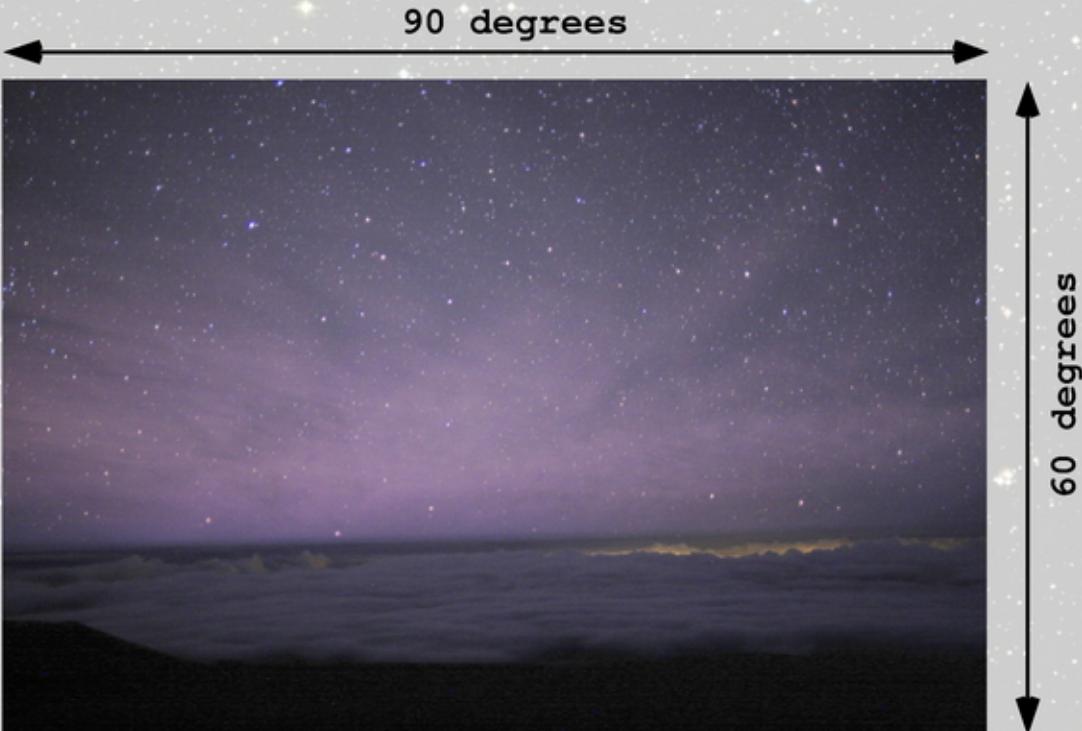

CFHT's CloudCam: a nighttime color webcam

Awesome Canon technology!

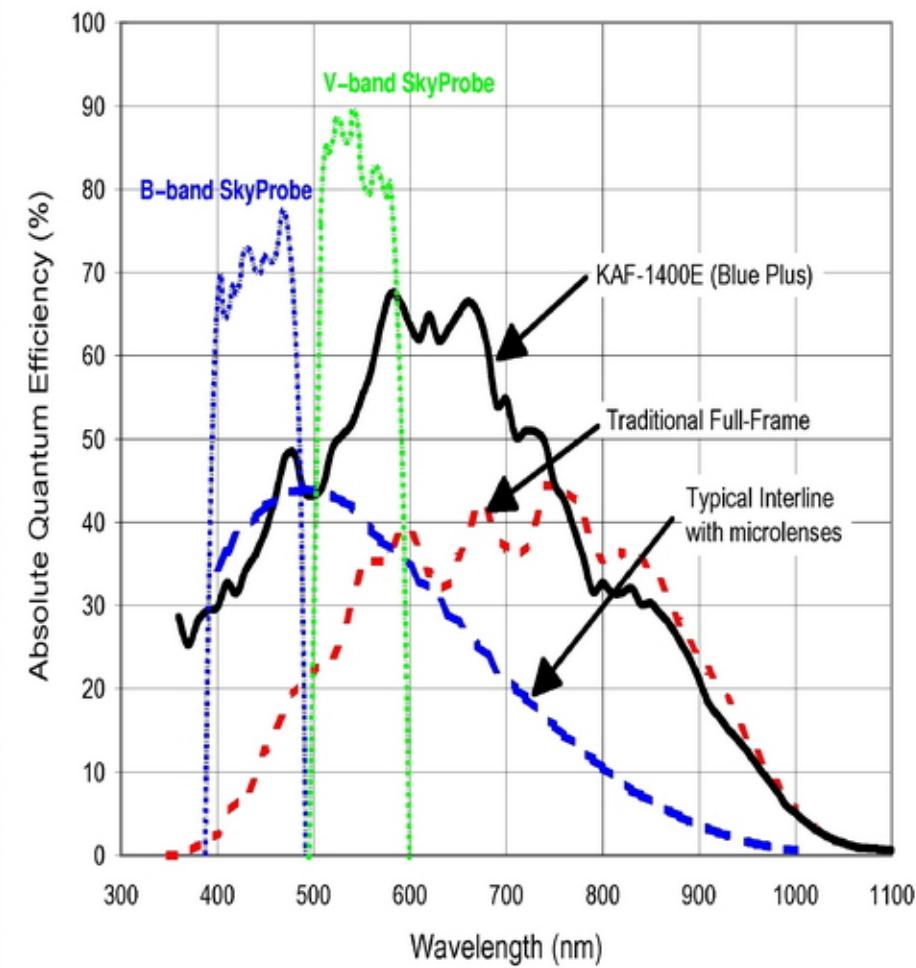

Sturdy housing

CMOS imaging (IR blocking filter removed)
Image shows airglow (strong I-band contribution)

An upcoming dual-channel system: SkyProbeBV

SkyProbeBV & SkyProbe at CFHT SkyProbeBV filters bandwidth
